Customer summary

12-mailbox.mbox#2@1372 · Evidence ID: E0016 · Case: RV-SAMPLE-001

Problem found

The file could not be fully examined or shows a serious problem.

What we did

Each file was read once to compute its digests, then analysed as email: .eml as an RFC 5322 message, .msg through its MAPI properties, and each message of an mbox as an item of its own (each in a separate worker process with time and memory limits when worker isolation is on, as recorded in the audit log). The header section, Received hops and dates were read and compared; DKIM and ARC signatures were verified offline with the public keys the examiner supplied (no DNS query unless online mode was chosen); Authentication-Results were recorded as stated evidence; attachments were hashed; and BEC heuristics compared the addresses with the organisation's own domains. Every step and every file written is recorded in the hash-chained audit log.

What we found

- DKIM body hash does not match. The DKIM signature of example.org (selector s2026) records a hash of the message body that differs from the hash of the body as it is now: the body is not the one that was signed.

Digital fingerprint

This fingerprint identifies the exact content of the file. Any change, even of one character, would produce a different value.

sha256	`a62b0d52faaaad62074e6f84f0f9c08c998c11138514f3f9db5a459231ab5c50`

Recommended next step

Do not rely on this file until the examiner has explained the problem.
