Customer summary

12-mailbox.mbox#3@2699 · Evidence ID: E0016 · Case: RV-SAMPLE-001

Needs attention

The file was hashed and checked. Some points need attention.

What we did

Each file was read once to compute its digests, then analysed as email: .eml as an RFC 5322 message, .msg through its MAPI properties, and each message of an mbox as an item of its own (each in a separate worker process with time and memory limits when worker isolation is on, as recorded in the audit log). The header section, Received hops and dates were read and compared; DKIM and ARC signatures were verified offline with the public keys the examiner supplied (no DNS query unless online mode was chosen); Authentication-Results were recorded as stated evidence; attachments were hashed; and BEC heuristics compared the addresses with the organisation's own domains. Every step and every file written is recorded in the hash-chained audit log.

What we found

- No DKIM signature. The message carries no DKIM-Signature header.
- Received times go backwards. Hop 2 was stamped 2026-11-11T09:40:00Z, 1200 s before the previous hop 1 (2026-11-11T10:00:00Z), beyond the tolerated clock difference (1 such step(s)).
- Date header later than the first server. The Date header (2026-11-11T11:30:00Z) is 5400 s later than the time the first server received the message (2026-11-11T10:00:00Z).
- Time zone inconsistent. The Date header uses zone +0500 while the sender organisation's first server used +0000 (sender_server_zone_differs).
- Message-ID from another domain. The Message-ID was generated under mailer.example.com, not under the From domain example.org.

Digital fingerprint

This fingerprint identifies the exact content of the file. Any change, even of one character, would produce a different value.
